**IMPORTANT:** Due to design limitations, the Voodoo 5 6000 can ONLY be used in a motherboard rated for AGP 3.3 (AGP 1x/2x/4x) specifications. Most newer motherboards especially Intel chipsets only support 1.5v or 0.8v so the Voodoo 5 5500/6000 will NOT WORK. Before making motherboard purchases, insure the AGP is Universal and can support 3.3 volt AGP connections!

Please note that it has also been reported that it makes a difference which revision of 6000 you have. Some 6000's have reportedly worked on a given motherboard while another revision might not, so compatibility may vary.
